EARLY INTERVENTION PROGRAMME

ABC AUTISM BEHAVIORAL CENTRE

For Early Intervention Supported By Research And Evidence

Early intervention promises the best outcomes for a child with needs; it is never too early to start. When their needs are met well, through evidence based intervention, they will have a better chance of thriving. The main objective of early intervention is to bridge the gap of skills so that children with development delays will be able to assimilate into mainstream schools and society independently and successfully. ABC (Autism Behavioral Centre) is the largest ABA 1:1 (Applied Behavior Analysis) Center in the country, with 40 individual therapy rooms and a highly conducive environment for teaching as well as learning, implementing the teaching protocols and procedures of PaTTAN (**Pennsylvania Training and Technical Assistance Network**) technology. Effective intervention is crucial for autistic children and at ABC, the ABA 1:1 method, which is the gold standard, research and evidence based supported intervention method, maximises its effectiveness. As a centre that is open for children with difficulties such as speech issues, ADHD (attention deficit hyperactivity disorder), GDD (global developmental delay), social challenges and disruptive behaviour, ABC adheres to international standards of intervention, and is supervised by a Board Certified Behavior Analyst (BCBA) and Board Certified Assistant Behavior Analysts (BCaBA). It is, by far, at the top of its class with experienced Case Supervisors and well-trained therapists who have received over 500 hours a month of training.
